

# Printing with Windows

## Choosing a printer

The Canon printers located in PZ, Z and TZ have this type:  
iR-ADV C3826 ( ImageRUNNER ADVANCE DX C3826i ) respectively  
iR-ADV C5840 ( ImageRUNNER ADVANCE DX C5840i )

The printers can do color prints, duplex, A3, sort and staple.

The printers are protected by a firewall setting and can only be accessed from the subnet of the computer science. Printing via WLAN (eduroam) or VPN (from home) is not possible.

<i>location</i>	<i>device name</i>	<i>IP</i>	<i>product name</i>
PZ 815	europa08	134.34.226.242	iR-ADV C3826
PZ 914	europa09	134.34.226.243	iR-ADV C5840
PZ 1015	europa10	134.34.226.244	iR-ADV C5840
ZT 8	europa11	134.34.227.15	iR-ADV C3826
Z 702	CANPRN111	134.34.224.197	iR-ADV C3826

To set up a printer, it may be sufficient to enter the IP address and/or the device name and have the printer created via auto-configuration. The printer knows its properties and transmits the correct values to the computer. If that doesn't work, the latest driver must be installed from the Canon website.

Google-search: [driver canon iR-ADV C3826i](#)  
[driver canon iR-ADV C5840i](#)

The first hit is a website on [www.canon.de](http://www.canon.de) and you should then look for the text "imageRUNNER ADVANCE DX" and select the operating system there. The postscript drivers are recommended  
„**PS Printer Driver & Utilities for Macintosh**“.

Prerequisites:

The computer must be in the same subnet /subnet of computer science) as the printer.
