| Quantitative tools for behavioral ecologists | 70 |
| Systems Toxicology | 72 |
| Theoretical and Experimental Ecology and Evolution..... | 74 |
| The role of microbes in stress response and resilience of aquatic metaorganisms | 76 |
| Optional Courses | 78 |
| Practical part: Practical work Experience..... | 79 |
| Master preparation course..... | 80 |
| Masters project..... | 81 |

Qualification aims of the M.Sc. “BIOLOGICAL SCIENCES”

General

The course of studies “M.Sc. Biological Sciences” imparts professional qualification in the areas of organismic as well as molecular biology.

The Masters-course provides a natural extension to the studies that builds upon the foundations laid as part of the bachelors-coursework. The theoretical, experimental and analytical abilities that the students acquired in their bachelor’s studies are to be extended upon and expanded to impart a specialization in one of the specified research foci of the Department of Biology (it should be stated that these research foci are not to be regarded as separate from one-another, but rather as intermeshing parts of the overall research pursued in the department). Aim of the masters-level course is to prepare the students for an academic or non-academic career pursuing basic science (i.e. Doctoral research/ Ph.D.), the pursuit of applied research in a biotechnology or industrial setting as well as the ability to work for service providers (e.g. “consulting firms” or ‘environmental agencies”) requiring a solid expertise in biological topics and the general natural sciences. For each student, the course of studies is individually adapted so as to best match their specific interests while also taking into account advice provided by the lecturers of the Department of Biology. In addition to extending their subject-specific theoretical and experimental knowledge, the students are also expected to expand and refine their abilities in other areas, such as developing additional competences in methods, communication or socially relevant topics. To this effect, the Department of Biology and other departments of the University of Konstanz offer a variety of optional modules the student can select from.

| | | | | | |
|---|---|-----------------|---|---|------|
| Study program/Usability | | | Module Title: | | |
| Master Biological Sciences Master Life Science | | | Preference Module | | |
| Credits | 8 | Duration | 1 Semester 4 SWS | Part of module of the total rating | 20 % |
| Module grade | | | In case of a compulsory course the module mark is composed of the arithmetic average of two selected courses within this module unit. In case of an optional course the module is not graded. | | |
| Module units | | | a. Disease Biology I b. Disease Biology II c. Pharmacology and Toxicology II d. Biochemistry III e. Methods in Biology f. Evolutionary Organismal Biology g. Concepts in Ecology | | |
| Qualification aims | | | After successful completion of two of courses offered as alternatives within this module the students will have acquired the following capabilities: <ul style="list-style-type: none"> - To give an account of the specific basics and important concepts of the fields chosen and to explain the current state-of-the art of science by using examples - To explain the relevant methodology and to give a critical evaluation thereof - To identify, collect, evaluate and correctly interpret scientific information relevant for a certain field, and to develop their own process of learning - To come up with further research questions in the field, based on current concepts and research data, and to select appropriate methodology - To find out where their own scientific interest lies and to critically evaluate it; assess if the knowledge and skills they have acquired in the field is going to contribute to their own qualification they aspire to. | | |
| Educational objectives | | | a-d. The objective is to give the students insight, at an advanced level, into major topics in the field of Biomedicine, as a basis for the full understanding of the current literature and for their own future experimental work in the field of Biomedicine. | | |

| | |
|---------------------------------|--|
| | <p>e. Get to know your possibilities: An overview on methods, techniques, and facilities available to you for your future (Master) research work at University of Konstanz.</p> <p>f. A wide overview of research in ecology and evolution at the University of Konstanz.</p> <p>g. The aim of the lecture is to introduce the students to basic conceptual approaches in ecology. Theoretical and modeling issues are presented at the integrative levels of behavioral, population and community ecology.</p> |
| Module unit | a. Disease Biology I |
| Coordinator | Prof. Dr. Ivano Amelio, Prof. Dr. Alexander Bürkle |
| Teaching content | <p>The topics covered deal with the pathology, pathogenesis, clinical picture, therapy and prevention of specific human diseases or disease groups; animal and in vitro models of human disease; and specific microbial pathogens, at the organismal, tissue, cellular and molecular level.</p> <p>Infectious Diseases (INF)/Specific Organs (ORG)/Cancer (CAN)</p> <ul style="list-style-type: none"> • Introduction / Model systems in Disease Biology • INF I: Viral infections • INF II: Fungal infections • INF III: Bacterial infections • INF IV: Protozoan infections • INF V: Inflammation / sepsis • ORG I: Autoimmune diseases and their therapy • ORG II: Pathogenesis of renal disease • ORG III: Chronic obstructive pulmonary disease • CAN I: Molecular pathogenesis of cancer: human colon cancer as an example • CAN II: Mitosis-Aneuploidy-Cancer: how mitotic checkpoints control chromosome segregation • CAN III: Oncogenes and transgenic models • CAN IV: Molecular Targets of current cancer chemotherapy • Epidemiological studies and clinical trials |
| Forms of teaching/Amount of SWS | Lecture/2 SWS |

| | |
|---------------------------------------|--|
| Work load | 30 h Attendance time 60 h Preparation and post-processing 30 h Exam preparation |
| Credits for this unit | 4 |
| Examination and unit completion | Written exam (2 h; questions in English, answers in English or German) |
| Prerequisites | Bachelor degree in Biological Sciences, Life Science or similar study courses |
| Language | English |
| Time slot and frequency of the module | Winter term |
| Module unit | b. Disease Biology II |
| Coordinator | Prof. Dr. Bürkle |
| Teaching content | <p>The topics covered deal with the pathology, pathogenesis, clinical picture, therapy and prevention of specific human diseases or disease groups; animal and in vitro models of human disease; and specific microbial pathogens, at the organismal, tissue, cellular and molecular level.</p> <p>Metabolic and cardiovascular disorders (MCD) / Modern approaches to therapy (MAT) / Nervous system disorders (NSD)</p> <p>MCD-1: Adiposity / neuroendocrinology / diabetes MCD-2: Hereditary diseases and disorders of imprinting MCD-3: Cardiac dysrhythmias MCD-4: Atherosclerosis and ischemic disease MCD-5: Inflammatory bowel disease MCD-6: Gout and rheumatoid arthritis MAT-1: Gene therapy MAT-2: Transplantation medicine MAT-3: Regenerative medicine NSD-1: Dementias NSD-2: Addiction NSD-3: Channelopathies NSD-4: Schizophrenia</p> |
| Forms of teaching/Amount of SWS | Lecture/2 SWS |
| Work load | 30 h Attendance time 60 h Preparation and post-processing 30 h Exam preparation |

| | |
|---------------------------------------|--|
| Credits for this unit | 4 |
| Examination and unit completion | Written exam (2 h; questions in English, answers in English or German) |
| Prerequisites | Bachelor degree in Biological Sciences, Life Science or similar study courses |
| Language | English |
| Time slot and frequency of the module | Summer term |
| Module unit | c. Pharmacology and Toxicology II |
| Coordinator | Prof. Dr. Alexander Bürkle |
| Teaching content | <p>The topics covered deal with current methodology in the field, including in vitro Toxicology, major molecular mechanisms involved in the cellular and organismal response to xenobiotics, in-depth discussion of major classes of natural or man-made hazardous substances, the pharmacology of selected disease groups and the interface between Toxicology and legislation (Regulatory Toxicology).</p> <p>The following specific topics are included:</p> <ul style="list-style-type: none"> • Basics of Toxicology / molecular targets of toxic substances/assessment of toxic effects • Pharmacology of hematopoiesis and blood coagulation • In vitro Toxicology • Cell death, necrosis, apoptosis • Neurotoxicology • Toxicokinetics and xenobiotic metabolism • Toxic industrial compounds • Chemical carcinogenesis • Toxic gasses and dusts • Pharmacogenomics and toxicogenomics • Nanotoxicology • Toxins from animals or plants / chemical warfare agents • Regulatory Toxicology • Pharmacology of water and electrolyte disturbances |
| Forms of teaching/Amount of SWS | Lecture/2 SWS |
| Work load | 30 h Attendance time 60 h Preparation and post-processing 30 h Exam preparation |

| | |
|---------------------------------------|---|
| Credits for this unit | 4 |
| Examination and unit completion | Written exam (2 h; questions in English, answers in English or German) |
| Prerequisites | Bachelor degree in Biological Sciences, Life Science or similar study courses |
| Language | English |
| Time slot and frequency of the module | Winter term |
| Module unit | d. Biochemistry III |
| Coordinator | Prof. Dr. Bürkle |
| Teaching content | The topics covered deal with fundamental cellular mechanisms like nucleotide synthesis, oxidative stress, inflammation, cell death, cellular and organismal ageing, cell cycle regulation and post-translational modification. |
| Forms of teaching/Amount of SWS | Lecture/2 SWS |
| Work load | 30 h Attendance time 60 h Preparation and post-processing 30 h Exam preparation |
| Credits for this unit | 4 |
| Examination and unit completion | Written exam (2 h; questions in English, answers in English or German) |
| Prerequisites | Bachelor degree in Biological Sciences, Life Science or similar study courses |
| Language | English |
| Time slot and frequency of the module | Summer term |
| Module unit | e. Methods in Biology |
| Coordinator | Prof. Dr. Schleheck, Dr. Marc Stift |
| Teaching content | A selection of seminars on current methods and techniques in use at the Department of Biology at University of Konstanz, presented by Postdocs of various groups and by members of the particular research facilities (Proteomics, Genomics, Microscopy units). |
| Forms of teaching/Amount of SWS | Lecture/2 SWS |

| | |
|---------------------------------------|---|
| Work load | 30 h Attendance time 60 h Preparation and post-processing 30 h Exam preparation |
| Credits for this unit | 4 |
| Examination and unit completion | Exam |
| Prerequisites | n/a |
| Language | English |
| Time slot and frequency of the module | Winter term |
| Module unit | f. Evolutionary Organismal Biology |
| Coordinator | Prof. Dr. Christian Voolstra |
| Teaching content | "Evolutionary Organismal Biology" is a lecture series that gives a wide overview of research in ecology and evolution at the University of Konstanz. Each lecture presents a general theme of one active researcher, with particular focus on ecological and evolutionary context. The lecture series is integrative and includes a wide range of contributions, e.g., from physiologists, limnologists and developmental and behavioural biologists. It is specifically intended for MA students who chose "Ecology and Evolution" as emphasis area but it is also open to other interested persons. |
| Forms of teaching/Amount of SWS | Lecture/2 SWS |
| Work load | 30 h Attendance time 60 h Preparation and post-processing 30 h Exam preparation |
| Credits for this unit | 4 |
| Examination and unit completion | written examination |
| Prerequisites | none |
| Language | English |
| Time slot and frequency of the module | summer term |
| Module unit | g. Concepts in Ecology |
| Coordinator | Prof. Dr. Becks, Prof. Dr. Peeters, PD Dr. Straile |
| Teaching content | optimal foraging, ecological stoichiometry versus essential biochemicals, |

| | |
|---------------------------------------|---|
| | chemical communication, life histories, population growth and demography, predator-prey models, intra- and interspecific facilitation, theory of food chains and food webs, spatial ecology, biological invasions, patterns and functional aspects of biodiversity |
| Forms of teaching/Amount of SWS | Lecture/2 SWS |
| Work load | 30 h Attendance time 60 h Preparation and post-processing 30 h Exam preparation |
| Credits for this unit | 4 |
| Examination and unit completion | Written exam, 90 minutes. |
| Prerequisites | Basic class/lecture in ecology. |
| Language | English |
| Time slot and frequency of the module | Winter term |

| Study program/Usability Master Biological Sciences Master Life Science | Module Title: Advanced Courses Advanced Technologies for the Life Sciences | | | | |
| <table border="1"> <tr> <td data-bbox="188 349 312 456">Credits</td> <td data-bbox="312 349 368 456">15</td> <td data-bbox="368 349 523 456">Duration</td> <td data-bbox="523 349 692 456">6 weeks</td> </tr> </table> | Credits | 15 | Duration | 6 weeks | The module mark for Life-Science-Students is composed of the individual examination results within this module. |
| Credits | 15 | Duration | 6 weeks | | |
| Module grade | Advanced course of scientific lab work consisting of lecture, practical part and single projects. | | | | |
| Educational objectives | <p>Lecture: The hosting Core Facilities will give lectures covering technologies, methodologies and tools used within. Based on this broad knowledge the students will learn how to do interdisciplinary research and include diverse methodologies in their experimental design and data collection. A special focus is on the connection of different experimental approaches that allow to add new information to the growing set of data.</p> <p>Seminar: In a journal club the students will learn how to read and interpret present scientific publications. Furthermore, in a second methodology literature project they should get deeper insight in various techniques and methods used in the field of scientific research.</p> <p>Practical part: In the practical part the students will prepare several relevant biological samples and will use the techniques and tools provided by the different Core Facilities to answer different scientific questions.</p> <p>Bio Imaging Center (BIC): Using several relevant biological samples students will learn how to solve scientific questions using different light microscopy methods. Students will learn how to prepare the samples for microscopy, to image the samples and analyze the images. Typical measurements to assess microscope performance will be demonstrated.</p> <p>Flow Cytometry Center (FlowKon): The course will provide a systematic theoretical and practical introduction to flow cytometry and fluorescence activated cell sorting. We will</p> | | | | |

| | |
|------------------|---|
| | <p>outline essential functional properties of fluorophores, explain basic rules of panel design and compensation. Students will learn how to prepare and analyse most frequent assays (apoptosis, cell cycle, immunophenotyping) on our high-end analysers.</p> <p>Electron Microscopy Center (EMC): On the basis of their own samples the students will learn how to handle, dissect and preserve different kinds of cells or tissue for ultrastructural analyses. They will have the opportunity to work at a scanning electron microscope or at a transmission electron microscope to visualize and analyse these structures in the nanometre scale.</p> <p>Sequencing Analysis Core Facility (SeqAna): The advent of next-generation sequencing (NGS) has transformed the life sciences. A human genome can now be sequenced in a matter of days for US\$1,000, and whole genome sequencing is now accessible for non-model organisms. About 30% of the course will cover theoretical aspects of molecular biology and wet lab techniques (sequencing library generation and quality control) and the remaining 70% will cover bioinformatics analysis (curation, processing and analysis of sequencing data). Students will work with command line-based applications and generate bespoke scripts (R, Python, awk). No prior knowledge will be assumed but students should be prepared to undertake self-study to familiarise themselves with required informatics skills that will be used in the instructor-led exercises.</p> <p>Colloquium: The students will learn to summarize, present and discuss the results of their own scientific projects in poster form.</p> |
| Module unit | a. Lecture and Seminar |
| Coordinator | Dr. Benjamin Hume, Dr. Michael Laumann, Dr. Martin Stöckl, Dr. Annette Sommershof |
| Teaching content | <p>Lecture: The lecture will cover the methods and analytical techniques used in the hosting Core Facilities and the tools and devices which are available and in action: This will cover the underlying theoretical principles, but also the classical methods to the point of up-to-date analytical techniques. In the field of cellular biology, genetics, bioinformatics and</p> |

| | |
|---------------------------------------|--|
| | <p>biochemistry the basics will be recapitulated as far as necessary for the different scientific projects.</p> <p>Seminar: The journal club focuses on current publications which will be discussed in detail. The topics are in accordance to the scientific work of the core facilities. Each student presents in a short oral presentation one original paper to get trained in critically assessing scientific publications. The methodology literature project deepens the knowledge given in the lectures regarding different techniques and methods: In groups of two the students will learn to summarize new applications in the field and introduce these techniques to their fellows via a short poster presentation.</p> |
| Forms of teaching/Amount of SWS | 5 |
| Work load | 60 h Attendance time 90 h Preparation and post-processing |
| Credits for this unit | 5 |
| Examination and unit completion | Journal club / seminar |
| Prerequisites | The course is open to all master students, experience in laboratory work is presumed. |
| Language | English |
| Time slot and frequency of the course | Winterterm, 1. half |
| Module unit | b. Practical part |
| Coordinator | Dr. Benjamin Hume, Dr. Michael Laumann, Dr. Martin Stöckl, Dr. Annette Sommershof |
| Teaching content | <p>Practical part: The course is based on a series of small research projects and hands-on modules in the hosting Core Facilities. The students will work in groups of four and are supervised by the researchers of the Core Facilities. Every group gets assigned to a small research project consisting of different hands-on modules in which the students will learn how to use the wet labs, tools and devices in the different Core Facilities. The groups will rotate through the different Core Facilities. The available projects are centred around the various services of</p> |

| | |
|---------------------------------------|--|
| | <p>the Core Facilities and will be presented in the first week of the course.</p> <p>Colloquium: At the end of the course each group will give a poster presentation of the results obtained during the practical part. While presenting each student will focus on one Core Facility associated part of their research project.</p> <p><i>Each group compiles and documents their data to make them available for further use in the Core Facilities.</i></p> |
| Forms of teaching/Amount of SWS | 10 |
| Work load | 200 h Attendance time 100 h preparation and post-processing |
| Credits for this unit | 10 |
| Examination and unit completion | Colloquium with poster presentation |
| Language | English |
| Time slot and frequency of the course | Winterterm, 1. half |

| | | | | |

| Study program/Usability | | | | Module Title: <u>Advanced Courses</u> |
| Master Biological Sciences Master Life Science | | | | |
| Credits | 15 | Duration | 6 weeks | Applied Bioinformatics for Studying Health and Disease |
| Module grade | | | | |
| Module units | | | | The module mark for Life-Science-Students is composed of the individual examination results within this module. |
| Educational objectives | | | | Advanced course of scientific lab work consisting of lecture, practical part and single projects. |
| Module unit | | | | Learn how to quality control and analyse next generation sequencing (NGS) data for studying health and/or disease. |
| Coordinator | | | | a. Lecture and Seminar |
| Teaching content | | | | Prof. Dr. Andreas Gruber |
| Forms of teaching/Amount of SWS | | | | The lectures cover the fundamentals of next generation sequencing (NGS) data analysis. The participants will gather knowledge on high-throughput sequencing technologies and data science techniques / tools to analyse and interpret large-scale NGS datasets. They will also learn how to read, interpret and present scientific publications (literature seminar). |
| Work load | | | | 5 |
| Credits for this unit | | | | 60 h Attendance time 90 h Preparation and post-processing |
| Examination and unit completion | | | | 5 |
| Prerequisites | | | | Journal club / seminar |
| Language | | | | B.Sc. degree. Interest in high-throughput sequencing technologies as well as in bioinformatics approaches and tools. |
| | | | | English |

| | |
|---------------------------------------|---|
| Time slot and frequency of the course | Winter term, 1. half |
| Module unit | b. Practical part |
| Coordinator | Prof. Dr. Andreas Gruber |
| Teaching content | Every participant gets assigned a small research project to learn (i) how to search databases for reference genomes, gene annotations, and datasets, (ii) perform quality control of next generation sequencing (NGS) data, (iii) map NGS data, (iv) infer global gene expression, (v) identify differential expressed genes, (vi) investigate gene expression at systems scale, (vii) identify transcriptional regulators, (viii) relate analysis results to the current scientific knowledge / publications, (ix) design a research project, follow-up analyses and validation experiments, (x) document, write-up and present analyses and research results, using FAIR (findable, accessible, interoperable, reusable) data principles. |
| Forms of teaching/Amount of SWS | 10 |
| Work load | 200 h Attendance time 100 h preparation and post-processing |
| Credits for this unit | 10 |

| Study program/Usability | | | | <u>Module Title: Advanced Courses</u> Behavioral Neurobiology |
| Master Biological Sciences Master Life Science | | | | |
| Credits | 15 | Duration | 6 weeks | |
| Module grade | | | | The module mark for Life-Science-Students is composed of the individual examination results within this module. |
| Module units | | | | Advanced course of scientific lab work consisting of a lecture, a seminar and a practical part with individual projects. |
| Educational objectives | | | | The lecture will cover basic principles of Behavioral Neurobiology with special emphasis on olfaction |
| Module unit | | | | a. Lecture and Seminar |
| Coordinator | | | | Prof. Dr. Bahl, Prof. Dr. Kleineidam, and others |
| Teaching content | | | | <p>The lecture covers both, contemporary techniques used in Neuroscience and an overview of classic topics in Behavioral Neurobiology. For further reading, we recommend the textbook: 'Behavioral Neurobiology' by Tom Carew. The lecture also includes a number of presentations by invited speakers, which gives the students the opportunity to learn more about different exciting research topics currently investigated.</p> <p>In addition, a paper seminar is held during one of the first weekends (usually the second weekend) where we discuss related publications at a retreat in the Alps. Here, the students present a publication, and the supervisors introduce their own field of research.</p> |
| Forms of teaching/Amount of SWS | | | | 5 |
| Work load | | | | 60 h Attendance time 90 h Preparation and post-processing |
| Credits for this unit | | | | 5 |
| Examination and unit completion | | | | Journal club / seminar |
| Prerequisites | | | | EOB and SIS or comparable background required. In case you did not attend one of the before mentioned classes, please contact Chr. Kleineidam |
| Language | | | | English |
| Time slot and frequency of the course | | | | Summer term, 2. half |

| | |
|---------------------------------------|--|
| Module unit | b. Practical part |
| Coordinator | Prof. Dr. Bahl, Prof. Dr. Kleineidam, and others |
| Teaching content | <p>students in this course will join one of our current research projects; either as single individuals or in pairs of two.</p> <p>Our main interest is Olfaction in Insects, Learning and Memory, and the proximate mechanisms for Social Organization in ants, bees and <i>Drosophila</i> flies and larvae.</p> <p>In order to study how insects, acquire and process odor information, we use a variety of different physiological techniques such as Calcium Imaging of the first olfactory neuropil, the antennal lobe, and electrophysiological approaches such as Single Neuron Recordings and Electroantennography. The connectivity of the olfactory pathway and modulation of information processing, e.g. during learning is investigated with neuroanatomical techniques such as Immunohistochemistry and subsequent Confocal Microscopy. The neuroanatomy of the insect brain is reconstructed by a detailed visualization based on image stacks using advanced 3D-software (AMIRA). Experimental setups that analyse the naïve responses of insects towards odors or even learning and memory on a behavioral level are used to test, how the insect brain organizes a particular insect behavioral. We address our questions in different insect species ranging from the model organism <i>Drosophila</i>, mosquitoes, bees and various ant species.</p> |

|---|----|-----------------|---------|---|
| Study program/Usability | | | | Module Title: <u>Advanced Courses</u> Biochemical Pharmacology |
| Master Biological Sciences Master Life Science | | | | |
| Credits | 15 | Duration | 6 weeks | |
| Module grade | | | | The module mark is composed of the individual examination results within this module. |
| Module units | | | | Advanced course of scientific lab work consisting of lecture, practical part and single projects. |
| Educational objectives | | | | The participants of the course should learn about the various molecular, biochemical and cellular processes underlying cell death induction and regulation and their consequences for health and disease. Furthermore, they should get a deeper insight into molecular mechanisms of immune regulation and immunopathological disorders of the liver, intestine, and lung, and their pharmacological control. Students will also present and discuss a scientific publication in the field. |
| Module unit | | | | a. Lecture and Seminar |
| Coordinator | | | | Prof. Dr. Brunner |
| Teaching content | | | | Regulation of cell death (apoptosis, necrosis, autophagy), cell biology, immunology, immunopathology, signal transduction, steroid synthesis, general pharmacology, in vitro and in vivo models, method applications |
| Forms of teaching/Amount of SWS | | | | 5 |
| Work load | | | | 60 h Attendance time 90 h Preparation and post-processing |
| Credits for this unit | | | | 5 |
| Examination and unit completion | | | | Colloquium |

| Study program/Usability | | | | Module Title: <u>Advanced Courses</u> Cell Biology - Cell Adhesion and Signal Transduction |
| Master Biological Sciences Master Life Science | | | | |
| Credits | 15 | Duration | 6 weeks | |
| Module grade | | | | The module mark for Life-Science-Students is composed of the individual examination results within this module. |
| Module units | | | | The advanced course consists of a theoretical part with lecture and seminar and a practical part with individual projects. |
| Educational objectives | | | | The students will be exposed to current conceptual and methodological approaches in cell biology with a particular emphasis on cell adhesion and signal transduction processes in animal cells. In the theoretical part a) of the module the students learn the current state of the art by focussed lectures. From this detailed theoretical background, the students should be able to frame a hypothesis together with their supervisor. Furthermore, in part a) the students present and discuss original publications and seminal contributions to the field in the form of a seminar to understand how to deconstruct published information. Thereby, they will acquire the knowledge to analyse key experiments and to integrate such approaches in their own practical project. In the practical part b) the students experimentally address current research questions with state-of-the-art equipment in a one-to-one interaction with their supervisor. Based on their hypotheses, the students will learn to plan and conduct different experiments including proper experimental controls. They will learn to critically analyse the raw data, summarize results, and present their data to peers. Finally, they will have the opportunity to refine or reformulate their starting hypothesis. The students should understand that this iterative process is key to scientific discovery |
| Module unit | | | | a. Lecture and Seminar |
| Coordinator | | | | Prof. Dr. Hauck |
| Teaching content | | | | The lectures cover the following areas of cell biology: adhesion molecules: integrins, IgCAMs; focal adhesions, protein and lipid phosphorylation: kinases/ phosphatases, adapter proteins/ protein-protein-interaction domains/ SH3-domains/ SH2- domains / ITAMs/ITIMs, endocytosis – |

| | |
|---------------------------------|---|
| | <p>autophagocytosis, lipid rafts, vesicle trafficking, dynamics of the actin cytoskeleton, regulation of cell migration, phagocytosis, innate immunity, cellular microbiology. Selected pathogenic bacteria will be presented (e.g. Neisseria, Haemophilus, Staphylococci) and medical aspects and their biology will be discussed.</p> <p>Furthermore, the second part of the lecture series addresses common experimental strategies, and the principles, application and pitfalls of the used methodology will be discussed. In particular we talk about:</p> <p>i) cell biological and genetic methods, e.g. cell culture, hybridoma cells, monoclonal antibodies, manipulation of cells – transfection, transduction, RNA-interference (RNAi), microRNAs, siRNA, shRNA, generation of viral particles, transgenic and knock-out mice, fluorescence labeling and – detection, flow cytometry, next-generation sequencing.</p> <p>ii) microscopy, electron microscopy and advanced light microscopy including confocal microscopy, TIRF, FRAP, FRET, FLIM</p> <p>iii) protein biochemistry, e.g. protein detection, epitope-tagging, affinity purification, Western Blotting, detection of protein-protein-interactions, protein-arrays, and identification of novel protein-protein-interactions</p> <p>The seminar focusses on current publications and breakthrough findings in the above mentioned areas, which will be discussed in detail. Each student presents one original paper.</p> |
| Forms of teaching/Amount of SWS | 5 |
| Work load | 60 h Attendance time 90 h Preparation and post-processing |
| Credits for this unit | 5 |
| Examination and unit completion | Seminar |
| Prerequisites | <p>The lectures Cell Biology I and II, Biochemistry II, and Immunology (BA Life Science or BA Biological sciences) or equivalents to these lectures must have been followed and passed. Attending the lecture Disease Biology I (especially the series on infectious diseases) is an asset. A specific introduction into laboratory safety is mandatory and will be given on the first day of the course</p> |

| | |
|---------------------------------------|---|
| Language | English |
| Time slot and frequency of the course | Winter term, 2. half |
| Module unit | b. Practical part |
| Coordinator | Prof. Dr. Hauck |
| Teaching content | <p>Individual projects will be conducted alongside existing lines of investigation in the field of cell adhesion receptors and address the following topics:</p> <p>CEACAMs, Integrins & pathogenic microbes / Regulation of cell adhesion / Advanced Methodology in Microscopy</p> <p>Examples of recent projects: CEACAM3 initiated signalling in granulocytes / The adapter molecule Nck is involved in phagocytosis / CEACAM1 localization to membrane microdomains / The role of Pyk2 in complement-mediated phagocytosis / Role of Vinculin in the Internalization of Staphylococcus aureus / Influence of CD105 on subcellular localization of zyxin / Role of Focal Adhesion Kinase (FAK) in cell migration</p> |
| Forms of teaching/Amount of SWS | 10 |
| Work load | 200 h Attendance time 100 h Preparation and post-processing |

|---|----|-----------------|---------|---|
| Study program/Usability | | | | Module Title: <u>Advanced Courses</u> Cellular Biochemistry |
| Master Biological Sciences Master Life Science | | | | |
| Credits | 15 | Duration | 6 weeks | |
| Module grade | | | | The module mark for Life-Science-Students is composed of the individual examination results within this module. |
| Module units | | | | Advanced course of scientific lab work consisting of lecture, practical part and single projects. |
| Educational objectives | | | | Introduction to the biochemistry and (patho-)physiology of the ubiquitin-conjugation system to prepare students for a future career in academia or industry |
| Module unit | | | | a. Lecture and Seminar |
| Coordinator | | | | Prof. Dr. Scheffner |
| Teaching content | | | | (1) Ubiquitin-conjugation system: history, current research concepts and activities, role in human disorders (2) Methods used in ubiquitin research including yeast genetics, mass spectrometry, unnatural amino acids (3) Cancer: "classical" and current concepts, DNA tumor viruses |
| Forms of teaching/Amount of SWS | | | | 5 |
| Work load | | | | 60 h Attendance time 90 h Preparation and post-processing |
| Credits for this unit | | | | 5 |
| Examination and unit completion | | | | Journal club / seminar |
| Prerequisites | | | | B.Sc. degree |
| Language | | | | English |
| Time slot and frequency of the course | | | | Summer term, 2. half |
| Module unit | | | | b. Practical part |
| Coordinator | | | | Prof. Dr. Scheffner |
| Teaching content | | | | The students will participate in current research projects and, depending on the individual project, will be acquainted with various biochemical/cell and molecular biological methods including PCR mutagenesis and cloning, protein expression and purification, enzyme assays, yeast and mammalian cell culture, mass spectrometry, etc. |

| | |

| Study program/Usability | | | | Module Title: <u>Advanced Courses</u> Chemical Ecology |
| Master Biological Sciences Master Life Science | | | | |
| Credits | 15 | Duration | 6 weeks | |
| Module grade | | | | The module mark for Life-Science-Students is composed of the individual examination results within this module. |
| Module units | | | | Advanced course of scientific lab work consisting of lecture, practical part and single projects. |
| Educational objectives | | | | <p>The students should realise that most aspects in Chemical Ecology are mediated by chemical processes. In order to successfully address biological questions, it is often crucial to appreciate their (bio)chemical basis.</p> <p>In interdisciplinary research it is necessary to be open minded and to include diverse methodologies in the experimental design. A broad knowledge in different techniques is communicated.</p> <p>The students should learn to design experiments, perform experiments independantly, to critically evaluate obtained experimental data and to present their results in a concise report.</p> |
| Module unit | | | | a. Lecture and Seminar |
| Coordinator | | | | Prof. Dr. Spiteller |
| Teaching content | | | | <p>Chemical ecology, microbial chemical ecology, natural products chemistry and biochemistry, chemistry of microbial symbionts, microbiology, secondary metabolites:</p> <p>Presentation of own research topics and current topics in microbial chemical ecology.</p> <p>Presentation of analytical techniques such as chromatography, HPLC, gas chromatography, mass spectrometry, MS Imaging, and NMR).</p> <p>Discussion of microbiology and molecular biology techniques (isolation, cultivation, bioassays, cloning techniques, analysis of gene clusters, phylogeny).</p> <p>General topics: experimental design, how to write a paper, how to give an oral presentation, bibliography.</p> <p>Short oral presentation of a research topic by each student.</p> |

| | |
|---------------------------------------|---|
| Forms of teaching/Amount of SWS | 5 |
| Work load | 60 h Attendance time 90 h Preparation and post-processing |
| Credits for this unit | 5 |
| Examination and unit completion | Journal club / seminar |
| Prerequisites | Solid knowledge in organic chemistry, analytical chemistry, biochemistry, and microbiology/molecular biology. Attendance of the lectures Bioorganic Chemistry and the lecture Chemical Ecology as basis for the practical course is expected. |
| Language | English |
| Time slot and frequency of the course | Winter term, 2. half |
| Module unit | b. Practical part |
| Coordinator | Prof. Dr. Spiteller |
| Teaching content | <p>Interdisciplinary course: Depending on the interests of the students the focus of the experiments can be microbiology/molecular biology or biochemistry and analytical chemistry.</p> <p>Microbiology and molecular biology techniques: isolation, cultivation, phylogeny, bioassays, gene cluster analysis, mutagenesis, heterologous expression of enzymes.</p> <p>Chemistry: biosynthetic studies, feeding studies, isolation of bioactive compounds, structure elucidation (mass spectrometry, NMR), functional analysis of secondary metabolite gene clusters, enzymology.</p> <p>Ecology: Bioassays, function of natural products.</p> |
| Forms of teaching/Amount of SWS | 10 |
| Work load | 200 h Attendance time 100 h Preparation and post-processing |
| Credits for this unit | 10 |
| Examination and unit completion | Colloquium and written report |
| Language | English |

| Study program/Usability | | | | Module Title: <u>Advanced Courses</u> Collective Animal Behaviour |
| Master Biological Sciences Master Life Science | | | | |
| Credits | 15 | Duration | 6 weeks | |
| Module grade | | | | The module mark for Life-Science-Students is composed of the individual examination results within this module. |
| Module units | | | | Advanced course of scientific lab work consisting of lecture, practical part and single projects. |
| Educational objectives | | | | Develop an understanding of collective animal behaviour, and how theoretical models and empirical studies together can provide new insights about complex systems |
| Module unit | | | | a. Lecture and Seminar |
| Coordinator | | | | Prof. Dr. Iain Couzin, Dr. Alex Jordan |
| Teaching content | | | | The lectures for this course will cover theoretical models explaining collective animal behaviour and explain how these lead to predictions about the benefits individuals gain by forming groups. The lectures will focus on modelling studies, but also review the empirical literature that has tested the predictions that models have generated. |
| Forms of teaching/Amount of SWS | | | | 5 |
| Work load | | | | 60 h Attendance time 90 h Preparation and post-processing |
| Credits for this unit | | | | 5 |
| Examination and unit completion | | | | Journal club / seminar |

| Study program/Usability | | | | Module Title: <u>Advanced Courses</u> Developmental Biology |
| Master Biological Sciences Master Life Science | | | | |
| Credits | 15 | Duration | 6 weeks | |
| Module grade | | | | The module mark for Life-Science-Students is composed of the individual examination results within this module. |
| Module units | | | | The advanced course consists of a theoretical part with lecture and seminar, and a practical part with individual projects. |
| Educational objectives | | | | The aim of this course is to familiarize students with fundamental principles of developmental biology, with an emphasis on pattern formation mediated by signalling molecules. The course participants will learn to conduct independent research projects and to present scientific findings to a broad audience. |
| Module unit | | | | a. Lecture and Seminar |
| Coordinator | | | | Prof. Patrick Müller |
| Teaching content | | | | The course is centered around modern approaches to the central question in developmental biology: How is a ball of nearly equal cells transformed into a structured embryo? And how does cellular communication via signaling molecules mediate this self-organizing process? In lectures, we will introduce exciting new areas in developmental biology and ongoing research in our lab. In tutorials, we will discuss classical techniques as well as quantitative tools for image-based studies in developmental biology, from image processing and data analysis to computational modeling. To get trained in critically assessing scientific publications, each student will present one paper describing a major finding in developmental biology. |
| Forms of teaching/Amount of SWS | | | | 5 |
| Work load | | | | 60 h Attendance time 90 h Preparation and post-processing |
| Credits for this unit | | | | 5 |
| Examination and unit completion | | | | Active participation in the lectures and paper presentation |
| Prerequisites | | | | Successful completion of basic modules (biochemistry, mathematics, physics) |

| | |
|---------------------------------------|---|
| Language | English |
| Time slot and frequency of the course | Summer term, 1. half |
| Module unit | b. Practical part |
| Coordinator | Prof. Patrick Müller |
| Teaching content | <p>The course participants will work on individual research projects to elucidate how signaling molecules control pattern formation in vertebrate embryos. The students will be trained and accompanied in their projects by experienced scientists. They can choose from a variety of experimental and theoretical techniques and combine them in new ways. Experimental techniques cover zebrafish and medaka embryology, molecular biology, and advanced imaging approaches such as light-sheet and high-throughput microscopy. Theoretical techniques range from basic and advanced image analysis to machine learning and numerical simulations of reaction-diffusion systems. The available projects, centered around ongoing research in our lab, will be presented on the first day of the course. The students will be mentored to present their research findings to an international audience and practice their skills by giving a presentation to the participants at the end of the course.</p> |

| Study program/Usability Master Biological Sciences Master Life Science | Module Title: Advanced Courses Dynamics of Aquatic Ecosystems |
| Credits 15 Duration 6 weeks | |
| Module grade | The module mark for Life-Science-Students is composed of the individual examination results within this module. |
| Module units | Advanced course of scientific lab work consisting of lecture, practical part and single projects. |
| Educational objectives | <p>The students learn that the investigation of ecological processes and their interactions in aquatic systems requires an interdisciplinary approach. They will acquire basic knowledge about physical limnology and oceanography, abiotic-biotic interactions, ecological modelling and implications of climate change on aquatic systems.</p> <p>The course communicates theoretical concepts and field methods that enable the students to independently conduct a process oriented research project. The main focus is on the interaction between ecological and physical processes in aquatic systems.</p> <p>The students learn how to design and conduct field experiments for the investigation of ecological processes. They learn how to analyse their data, and to critically evaluate the results of their work with respect to existing knowledge.</p> <p>They learn to communicate scientific results in form of oral presentations and scientific manuscripts.</p> |
| Module unit | a. Lecture and Seminar |
| Coordinator | Prof. Dr. Peeters |
| Teaching content | Basic principles in physical limnology (exchange and transport processes, tracer techniques), relevance and release of methane, utilization of acoustic techniques in aquatic systems, plankton patchiness, waves and their ecological relevance, basic ocean dynamics, climate change, introduction to ecological modelling, case studies from specific lakes. The lectures not only present basic principles but will also show recent results from the current projects of the research group. We will have additional presentations from invited guests addressing specific research topics. |

| | |
|---------------------------------------|---|
| | Seminar: In the seminar the participants present selected articles relevant for their projects. |
| Forms of teaching/Amount of SWS | 5 |

| Module unit | b. Practical part |
| Coordinator | Prof. Dr. Peeters |
| Teaching content | <p>Introduction to field techniques in lake research (water sampling, in-situ techniques from a boat on Lake Constance), water sample analyses (e.g. zooplankton, methane, toxins) and data analysis using MATLAB (hands-on tutorial).</p> <p>Conduction of a research project according to the current focus of the group (e.g. temporal and spatial distribution patterns of plankton or methane). Typically this include 2 weeks of field work at a specific site (e.g. Lake Ammer, Illmensee, Untersee, Obersee). Projects focussing on modelling may also be possible if desired.</p> <p>The students work in groups of two. They develop a work plan for their project, conduct the field work and analyse the data with the support of a project supervisor. All projects are integrated part of our current research. After three weeks intermediate results are presented by the research groups and discussed with the other participants and supervisors of the course to adjust the remaining research program based on the information gained so far. At the end of the course the project results will be presented by the research groups in a poster session. Each group compiles and documents their data to make them available for further use in our research group.</p> <p>After the course the students provide a summary of their project work in the format of a scientific manuscript consisting of an abstract, an introduction providing the motivation of the</p> |

| Study program/Usability | | | | Module Title: <u>Advanced Courses</u> Environmental Genomics |
| Master Biological Sciences Master Life Science | | | | |
| Credits | 15 | Duration | 6 weeks | |
| Module grade | | | | The module mark for Life-Science-Students is composed of the individual examination results within this module. |
| Module units | | | | Advanced course of scientific lab work consisting of lecture, practical part and single projects. |
| Educational objectives | | | | <p>In this course you will</p> <ul style="list-style-type: none"> ▪ gain a thorough current understanding and practical experience of the application and uses of environmental DNA in ecological research ▪ learn how to analyse eDNA data ▪ acquire skills in designing and conducting a research project ▪ gain an understanding of the scales and causes of ecosystem changes at different timescales (centennial, millennial) and acquire knowledge of fundamental paleoecological concepts and methods. ▪ expand your presentation skills |
| Module unit | | | | a. Lecture and Seminar |
| Coordinator | | | | Prof. Laura Epp |
| Teaching content | | | | <p>Current advances in molecular genetic techniques offer the possibility to investigate present and past biodiversity using DNA extracted directly from environmental samples, such as water or sediments. This environmental DNA (eDNA) is shed into the environment by all organisms, both microbial and macrobial, and it can be used to identify species and sub-specific variation. We can thus analyse diversity patterns in space and through time, both at the level of species composition of biotic communities and within single species.</p> <p>Techniques and theoretical concepts covered</p> <ul style="list-style-type: none"> ▪ sampling and extraction of environmental DNA. ▪ specificities of working with ancient and degraded DNA. ▪ bioinformatic design of reactions to trace target organisms in water and sediments. ▪ wet-lab evaluation and application of these reactions: (quantitative) PCR and DNA-metabarcoding. |

| | |
|---------------------------------------|--|
| | <ul style="list-style-type: none"> ▪ bioinformatic analyses of NGS sequencing data from environmental samples ▪ taxonomic assignments of DNA sequences using reference databases ▪ statistical analyses of eDNA data in (paleo)ecology <p>In the lecture course, you will be introduced to the underlying theoretical principles of environmental DNA analyses and will learn analytical skills. In a literature seminar you will present and discuss papers highlighting current applications of environmental DNA in ecology and paleoecology.</p> |

| Master Biological Sciences Master Life Science | | | | |
| Credits | 15 | Duration | 6 weeks | |
| Module grade | | | | The module mark for Life-Science-Students is composed of the individual examination results within this module. |
| Module units | | | | Advanced course of scientific lab work consisting of lecture, practical part and single projects. |
| Educational objectives | | | | <p>The major objectives are that by the end of this course, the students will know:</p> <ul style="list-style-type: none"> • What is plant ecology, and why it is important. • What are big questions in plant ecology. • How to test hypotheses in plant ecology. • What are the major methods and approaches in plant ecology. • How to set-up, run and analyse experiments in plant ecology. • How to present results of plant ecological studies. |
| Module unit | | | | a. Lecture and Seminar |
| Coordinator | | | | Prof. Dr. van Kleunen |
| Teaching content | | | | In the lectures, we teach the major theories in plant ecology. Some examples of topics are plant life-histories, dispersal and pollination, functional diversity and invasion ecology. In seminars, the students present and discuss recent publications. |
| Forms of teaching/Amount of SWS | | | | 5 |
| Work load | | | | 60 h Attendance time 90 h Preparation and post-processing |
| Credits for this unit | | | | 5 |
| Examination and unit completion | | | | Journal club / seminar |
| Prerequisites | | | | Requirement for the course are basic knowledge of ecology (the 3rd semester course "Ökologie", the book "The Ecology of Plants" by Gurevitch, Scheiner and Fox, particularly Chapter 1 and Chapters 5-13) and basic knowledge of statistical methods. |
| Language | | | | English |
| Time slot and frequency of the course | | | | Summer term, 2. half |

| | |
|---------------------------------------|--|
| Module unit | b. Practical part |
| Coordinator | Prof. Dr. van Kleunen |
| Teaching content | In addition to the lectures and seminars, we teach practicals and workshop, and the students have to do a research project. In the practicals and workshops, we teach major skills and methods in plant ecology. In the research projects, the students will have to put the acquired skills and knowledge into practice. Collaborating in groups of 2-4 persons, students will obtain experience in all aspects of scientific research: from design and planning to analysis and presentation of results. The projects will be independent or directly linked to ongoing studies in our group, and are supervised by PhD students and postdocs. |

| Credits | 15 | Duration | 6 weeks | Immunology |
| Module grade | | | | |
| The module mark for Life-Science-Students is composed of the individual examination results within this module. | | | | |
| Module units | | | | Advanced course of scientific lab work consisting of lecture, practical part and single projects. |
| Educational objectives | | | | Presentation of research publications in the field of immunology. Understanding of how and when immunological techniques are applied in research in immunology. Overview of latest concepts in immunobiology. |
| Module unit | | | | a. Lecture and Seminar |
| Coordinator | | | | PD Dr. Basler, PD Dr. Schmidtke |
| Teaching content | | | | Antiviral response, T helper cell differentiation, lineage commitment, thymic T cell selection, antigen processing pathways, ubiquitin-proteasome system, T cell vaccination, tumor immunology. |
| Forms of teaching/Amount of SWS | | | | 5 |
| Work load | | | | 60 h Attendance time 90 h Preparation and post-processing |
| Credits for this unit | | | | 5 |
| Examination and unit completion | | | | Journal club / seminar |
| Prerequisites | | | | Lecture on Immunology in the fourth semester with written exam at Konstanz University or equivalent education at external universities. |
| Language | | | | English |
| Time slot and frequency of the course | | | | Winter term, 1. half |
| Module unit | | | | b. Practical part |
| Coordinator | | | | PD Dr. Basler, PD Dr. Schmidtke |
| Teaching content | | | | Practical application of research methods in immunology like intracellular cytokine staining, ELISA, ELISPOT, proliferation assay, flow cytometry, cell sorting, immunization of mice, virus plaque assays, tumor imaging. |
| Forms of teaching/Amount of SWS | | | | 10 |

| | |

| Study program/Usability | | | | Module Title: Advanced Courses Microbial Ecology and Limnic Microbiology |
| Master Biological Sciences Master Life Science | | | | |
| Credits | 15 | Duration | 6 weeks | |
| Module grade | | | | The grading for the Life-Science-Students is based on the individual examination results within this module. |
| Module units | | | | Advanced course of scientific lab work consisting of lectures, seminars and single research projects. |
| Educational objectives | | | | Understanding the activities of microbes, for example in the aquatic environment, and the physiology and biochemistry behind their cycling of matter and covering their growth requirements. |
| Module unit | | | | a. Lecture and Seminar |
| Coordinator | | | | Prof. Dr. David Schleheck |
| Teaching content | | | | Cultivation of aerobic and anaerobic bacteria in the lab. Analytical-chemical, biochemical and molecular methods for Microbial Ecology lab work. Dissimilatory and assimilatory metabolism. Aerobic and anaerobic degradation of organic matter. Fermentations, sulfate reduction, methanogenesis, syntrophic associations, dehalorespiration. Roles of microbes in biogeochemical carbon, nitrogen, sulfur and phosphorus cycling. Limits of microbial transformation (e.g. pesticides, plastic). Starvation and survival. Microbial communities and microbial biofilms. Cell-cell interactions, chemical communication and signalling (quorum sensing). Cultivation-independent techniques of microbial community analysis. Microbial ecology of specific environments, e.g., lake water column and sediment, soil, intestinal systems of humans and animals, extreme environments. |
| Forms of teaching/Amount of SWS | | | | 5 |
| Work load | | | | 60 h Attendance time 90 h Preparation and post-processing |
| Credits for this unit | | | | 5 |
| Examination and unit completion | | | | Journal club / literature seminar |
| Prerequisites | | | | At least one course in basic microbiology and basic experience in microbiological lab work are required. Basic |

| | |
|---------------------------------------|---|
| | knowledge in biochemistry is also required. Experience in molecular biology and analytical chemistry is helpful. |
| Language | English |
| Time slot and frequency of the course | Winter term, 2. half |
| Module unit | b. Practical part |
| Coordinator | Prof. Dr. David Schleheck |
| Teaching content | <p>We study environmental bacteria (from water, soil, human gut) in our lab for their biodegradation capabilities and the underlying biochemical transformations, enzymes and genes. This includes growth of the strains in batch or continuous culture, quantifying biomass formation, substrate disappearance and product formation, and balancing of the metabolism. In the past, bacterial pathways for degradation of industrial chemicals and natural organo-sulfur compounds have been studied in aerobic as well as anaerobic strains, including the enzymes catalyzing these transformations. Our research involves also genome sequencing, proteomic and transcriptomic analysis, and production of enzymes by heterologous expression. Another research avenue aims at characterizing microbial communities right in their environment, by total DNA extraction and meta-genomic sequencing (Bodensee plankton and biofilms).</p> <p>Projects offered will be chosen based on the research currently being done in the lab. However, you are also strongly encouraged and highly welcome to propose your own research project; please discuss this with us in advance.</p> |

| Study program/Usability | | | | Module Title: <u>Advanced Courses</u> Molecular Evolutionary Biology |
| Master Biological Sciences Master Life Science | | | | |
| Credits | 15 | Duration | 6 weeks | |
| Module grade | | | | The module mark for Life-Science-Students is composed of the individual examination results within this module. |
| Module units | | | | The advanced course consists of a theoretical part with lecture and seminar and a practical part with individual projects. |
| Educational objectives | | | | We study several fundamental issues in evolutionary and developmental biology, as well as comparative genomics and bioinformatics. The evolution of biodiversity, and specifically the developmental basis and molecular and genomic causes of morphological diversity between species are of interest to us. We would like to better understand the relationship between tempo and mode of evolution both in terms of morphological adaptation and speciation on one hand and genetic differentiation among species and speciation on the other. In trying to understand the origin and maintenance of biodiversity we mostly use molecular approaches, namely the study of mitochondrial and nuclear DNA variation (in protein coding genes and microsatellites), to ask how much genetic divergence accompanies morphological differentiation among populations and separates species. |
| Module unit | | | | a. Lecture and Seminar |
| Coordinator | | | | Prof. Dr. Meyer |
| Teaching content | | | | We will have daily lectures on topics including developmental-evolutionary biology as well as major themes in evolutionary biology. Other topics will cover some of the theory behind molecular phylogenetics, genomics and bioinformatics. |
| Forms of teaching/Amount of SWS | | | | 5 |
| Work load | | | | 60 h Attendance time 90 h Preparation and post-processing |

| Study program/Usability | | | | Module Title: Advanced Courses |
| Master Biological Sciences Master Life Science | | | | |
| Credits | 15 | Duration | 6 weeks | Molecular Genetics: Cell cycle regulation – from mechanisms to disease |
| Module grade | | | | |
| Module units | | | | The module mark for Life-Science-Students is composed of the individual examination results within this module. |
| Educational objectives | | | | Advanced course of scientific lab work consisting of lecture, practical part and single projects. |
| Module unit | | | | This course enables students to understand the molecular mechanism underlying mitotic and meiotic divisions in higher eukaryotes. At the end of the course, the students will understand how cell cycle progression is regulated by posttranslational modifications of key cell cycle regulators and how mitotic kinesins facilitate the equal distribution of the genome in mitosis. |
| Coordinator | | | | a. Lecture and Seminar |
| Teaching content | | | | Prof. Dr. Th. Mayer |
| Forms of teaching/Amount of SWS | | | | Molecular insights into the regulatory mechanisms controlling cell cycle progression in mitosis and meiosis. A particular focus will be on the function and regulation of ubiquitin ligases during the cell cycle. In addition, the molecular mechanisms enabling motor proteins to move along microtubules and the regulation of this process in mitosis will be explained in detail. |
| Work load | | | | 5 |
| Credits for this unit | | | | 60 h Attendance time 90 h Preparation and post-processing |
| Examination and unit completion | | | | 5 |
| Prerequisites | | | | Journal club / seminar |
| Language | | | | Knowledge of the basic concepts of mitotic and meiotic cell cycle regulation in higher eukaryotes. Insights into the function and regulation of mitotic motor proteins. Knowledge of the respective chapters in the textbook " Cell Cycle" by David Morgan is regarded as prerequisite. |
| | | | | English |

| | |
|---------------------------------------|--|
| Time slot and frequency of the course | Winter term, 1. half |
| Module unit | b. Practical part |
| Coordinator | Prof. Dr. Th. Mayer |
| Teaching content | Experimental insights into the regulatory mechanisms underlying mitotic and meiotic cell cycle progression. Experimental insights into the function and regulation of motor proteins. The <i>Xenopus</i> egg extract and human tissue culture cells are used as model systems. Biochemical, cell biological approaches are combined with high resolution live-cell microscopy. In addition, small molecules are applied to modulate protein function on a fast time scale. |

| Study program/Usability Master Biological Sciences Master Life Science | Module Title: Advanced Courses Physiology and Biochemistry of Plants |
| Credits 15 Duration 6 weeks | |
| Module grade | The module mark for Life-Science-Students is composed of the individual examination results within this module. |
| Module units | The advanced course consists of a theoretical part with lecture and seminar and a practical part with individual projects. |
| Educational objectives  | <p>Lecture: The students will learn to understand the molecular and genetic basis of selected topics in physiology and biochemistry of plants and algae. A special focus is on experimental approaches that allow to gain new information about functional aspects of plant and algae metabolism and its regulation by internal and external factors.</p> <p>Seminar: The students will learn how to read and interpret scientific literature and how to present hypotheses or experimental data to a broader audience.</p> <p>Practical part: In close contact with the active researchers in the lab the students will learn how to perceive a scientific problem and how to develop an experimental approach to test a hypothesis or how to extract knowledge from unbiased data acquisition. They will have the opportunity to learn and apply up to date methods in plant and cyanobacteria research. The students will also learn how to summarise and discuss their project work in written form.</p> <p>Colloquium: The students will learn to present their scientific project and the results obtained during the practical part. They will also learn how to perceive and analyse a scientific presentation.</p> |
| Module unit | a. Lecture and Seminar |
| Coordinator | Prof. E. Isono |
| Teaching content | Lecture: Based on the current research projects in the Isono and Kroth labs, the lecture will present recent results in the field of physiology and biochemistry of plants and algae. The topics currently include adaptation of plants to environmental stress, especially high light stress and drought/salinity as well as the regulation of cellular functions |

| | |
|---------------------------------------|--|
| | <p>by proteases.</p> <p>On the algae side, the focus is on compartmentation of metabolism and protein transport in diatoms and other algae with complex plastids. Recent advances in algae genomics are also presented.</p> <p>Seminar: Topics will be chosen by the students in accordance with the topics of their practical parts.</p> |
| Forms of teaching/Amount of SWS | 5 |
| Work load | 60 h Attendance time 90 h Preparation and post-processing |
| Credits for this unit | 5 |
| Examination and unit completion | Seminar |
| Prerequisites | The course is open to all master students. Experience in laboratory work is presumed. Good basic knowledge of botany and plant physiology are expected along with a genuine interest in the special challenges that autotrophic organisms have to face in the environment. |
| Language | English |
| Time slot and frequency of the course | Summer term, 1. half |
| Module unit | b. Practical part |
| Coordinator | Prof. E. Isono |
| Teaching content | <p>Practical part: The students will participate in current research projects of the plant physiology and biochemistry lab. 1 or 2 students will be supervised by a PhD student or advanced researcher. The actual content depends on the topics available and the methodological focus of the supervisors.</p> <p>Colloquium: Each student will give an oral presentation of the results obtained during the practical part. Special focus is on the comprehensiveness and professionalism of the presentation.</p> |

| Study program/Usability | | | | Module Title: Advanced Courses Quantitative tools for behavioral ecologists |
| Master Biological Sciences Master Life Science | | | | |
| Credits | 15 + 3 | Duration | 6 + 2 weeks | |
| Module grade | | | | The module mark for Life-Science-Students is composed of the individual examination results within this module. |
| Module units | | | | Advanced course in scientific fieldwork and data analysis consisting of lecture, practical part and individual and/or group projects; must be taken in conjunction with " <i>Field Research in Behavioral Ecology</i> " |
| Educational objectives | | | | This course aims to help students develop scientific reasoning, quantitative and analytical proficiency, and research design and hands-on data collection skills, all in the context of real field-based research. |
| Module unit | | | | a. Lecture and Seminar |
| Coordinator | | | | Prof. Margaret Crofoot; Dr. Alex Jordan; Dr. Ariana Strandburg-Peshkin, Dr. Urs Kalbitzer |
| Teaching content | | | | The course will be based around a series of hands-on modules in which students learn quantitative and programming skills by interacting with real biological data as well the basic concepts of behavioral ecology. Students will learn how to design studies to ask specific biological questions and how to wrangle, visualize, and interpret the resulting data to answer those questions. In conjunction with short lectures on important concepts in programming, data analysis and behavioral ecology, they will get to "play" with a variety of existing datasets from recent and current studies in behavioral ecology. |
| Forms of teaching / Amount of SWS | | | | 5 |
| Work load | | | | 60 h Attendance time 90 h Preparation and post-processing |
| Credits for this unit | | | | 5 (+ 3 for Field research) |
| Examination and unit completion | | | | Journal club / seminar |

| Language | | | | English |
| Time slot and frequency of the course | | | | Summer term, 1. half |
| Module unit | | | | b. Practical part |

| | |
|---------------------------------------|---|
| Coordinator | Prof. Margaret Crofoot; Dr. Alex Jordan; Dr. Ariana Strandburg-Peshkin, Dr. Urs Kalbitzer |
| Teaching content | <p>The practical part of the advanced course is combined with the 2 week course “<i>Field Research in Behavioral Ecology</i>” coordinated by Dr. Alex Jordan.</p> <p>Students will apply their skills by designing their own research projects to be carried out in the field in groups of 2-3 students per project. The students will spend two weeks at an international field station and perform their own studies of animals in the wild, while also participating in lectures on biology and diversity of local fauna and relevant theory. Studies can be experimental or observational and may include emerging technologies and methods in field biology including, for example, bio-telemetry, environmental remote sensing, camera-trapping, and photogrammetry.</p> <p>After the field trip, students will participate in lectures and workshops on data analysis, computational ethology, interpretation, manuscript preparation, and science communication. In the final week, students will participate in a mini-conference presenting posters and/or scientific seminars on the results of their experiments.</p> |
| Forms of teaching / Amount of SWS | 10 (+ 4, “ <i>Field Research in Behavioral Ecology</i> ”) |

| Module unit | | | | b. Practical part |
| Coordinator | | | | Prof. Dr. Ivano Amelio |
| Teaching content | | | | The students involved in the practical components will be integrated in the research activity of the group under the guidance of a tutor. The students will be assigned a specific experimental task (i.e. small project) that will represent part of a larger research project conducted in the laboratory. The student will be coached and trained for the experimental procedures, and the analysis and interpretation of the data with |

| | <p>the goal of preparing her/him to future research activities in the area. Current research projects in the Chair for Systems Toxicology:</p> <ul style="list-style-type: none"> - Molecular mechanisms for maintenance of genome integrity - Identification of novel genomic loci for hypersusceptibility to genotoxicants (Fbox proteins). - Context-dependent cell death decisions in response to cytotoxic drugs - Role of p53 variants in tumorigenesis - Epigenetic regulations of stress response by BAP-1 |
| Forms of teaching / Amount of SWS | 10 |
| Work load | 200 h Attendance time 100 h Preparation and post-processing |
| Credits for this unit | 10 |
| Examination and unit completion | Colloquium and written report |
| Language | English |
| Time slot and frequency of the course | Summer term, 2. half |

| | | | |
|---|----|---|--|
| Study program/Usability | | Module Title: Advanced Courses | |
| Master Biological Sciences Master Life Science | | Theoretical and Experimental Ecology and Evolution | |
| Credits | 15 | | |
| Module grade | | The module mark for Life-Science-Students is composed of the individual examination results within this module. | |
| Module units | | Advanced course of scientific lab work consisting of lecture, practical part and single projects. | |
| Educational objectives | | The participants of the course will learn about the novel research field of eco-evolutionary dynamics, ecological and evolutionary theory of species interactions and community ecology. | |
| Module unit | | a. Lecture and Seminar | |
| Coordinator | | Prof. Dr. Becks | |
| Teaching content | | The participants will learn to identify research questions and design their own experiments and analyses of mathematical models to answer research questions. They will learn a large range of methods used in ecology and evolution. | |
| Forms of teaching/Amount of SWS | | 5 | |
| Work load | | 60 h Attendance time 90 h Preparation and post-processing | |
| Credits for this unit | | 5 | |
| Examination and unit completion | | Journal club / seminar | |
| Prerequisites | | Interest in ecology and evolutionary biology. | |
| Language | | English | |
| Time slot and frequency of the course | | Summerterm, 1. Half | |
| Module unit | | b. Practical part | |
| Coordinator | | Prof. Dr. Becks | |

| | | | | |
|---|----|-----------------|---------|---|
| Study program/Usability | | | | Module Title: Advanced Courses |
| Master Biological Sciences Master Life Science | | | | |
| Credits | 15 | Duration | 6 weeks | The role of microbes in stress response and resilience of aquatic metaorganisms |
| Module grade | | | | The module mark for Life-Science-Students is composed of the individual examination results within this module. |
| Module units | | | | The advanced course consists of a theoretic/background part with lectures and seminars and a practical part with individual projects. |
| Educational objectives | | | | <p>The students will be exposed to current conceptual and methodological approaches in metaorganism research. All plant and animal organisms alike associate with microbes that contribute to their ecology, well-being, and even adaptation. In the course, we will cover how to study microbial diversity and function with a particular emphasis on coral metaorganisms and aquatic model system metaorganisms. In the theoretical part of the module, the students learn about the current state of the field by lectures. Based on this background, they are encouraged to develop a hypothesis together with their supervisor. Furthermore, in this part of the course the students present and discuss original publications in the form of a seminar to understand how to deconstruct published information.</p> <p>In a second practical part, the students address experimentally or bioinformatically current research questions in a one-to-one interaction with their supervisor. Based on the framed hypotheses, the students will learn to plan and conduct experiments including the design of proper experimental controls. The students will learn to generate and analyze raw data, summarize results, and present their data to peers. Finally, the students will have the opportunity to refine or reformulate their starting hypothesis. The students should understand that this iterative process is key to scientific discovery.</p> |
| Module unit | | | | a. Lecture and Seminar |
| Coordinator | | | | Prof. Dr. Voolstra |

| | |
|---------------------------------------|---|
| Teaching content | The lectures cover the following areas of microbial ecology/metaorganism genomics: holobionts and metaorganisms; signaling between microbes and animal/plant hosts; cnidarian-dinoflagellate symbiosis; coral reefs; coral bleaching; stress resilience; stress tolerance; aquatic ecosystems; emerging model systems; functional microbial ecology; climate change. We will also cover experimental strategies, experimental design types, limitations of methodologies, next-generation sequencing, metagenomics, metatranscriptomics, marker gene sequencing, gene expression profiling, introduction to metabolomics. |
| Forms of teaching/Amount of SWS | 5 |
| Work load | 60 h Attendance time 90 h Preparation and post-processing |
| Credits for this unit | 5 |
| Examination and unit completion | Seminar |
| Prerequisites | Knowledge on Molecular Biology, Genomics, Microbiology, Ecology are an asset. |
| Language | English |
| Time slot and frequency of the course | Winter term, 2. Half |
| Module unit | b. Practical part |
| Coordinator | Prof. Dr. Voolstra |
| Teaching content | Individual projects will be conducted alongside existing lines of research concerning the role of microbes in stress response and resilience of aquatic metaorganisms that address the following topics: microbes and thermal tolerance, microbes and stress resilience, role of specific bacteria to coral health, role of specific bacteria in the model system Aiptasia, probiotics to increase metaorganism resilience, metaorganism composition across environmental gradients, effect of climate change on metaorganism composition and function |

| Credits for this unit | 10 |
| Examination and unit completion | Colloquium and written report |
| Language | English |
| Time slot and frequency of the course | Winter term, 2. half |

MODULE TITLE:

Optional Courses

The list of compulsory/optional courses may vary from semester to semester; some of them are offers only in one year periods. The actual list is available at the ZEuS:

https://zeus.uni-konstanz.de/hioserver/pages/cm/exa/coursecatalog/showCourseCatalog.xhtml?_flowId=showCourseCatalog-flow&_flowExecutionKey=e6s1

| | | | | |
|--|----|-----------------|---------|---|
| Study program/Usability Master Biological Sciences | | | | Practical part: Practical work Experience |
| Credits | 15 | Duration | 2 month | |
| Module grade | | | | The module is ungraded. |
| Module units | | | | The module consists of a practical part mainly at non-university research institutions. |
| Educational objectives | | | | The students will be exposed to conditions and concepts of practical research within the context of industrial research. The students will get experience as a training on the job. |
| Coordinator | | | | Professors of the Department of Biology |
| Teaching content | | | | <ul style="list-style-type: none"> • A practical part at the respective research institutions and writing of an experience report. • lectures offered as part of an advanced module (worth 5 credits) <p>A university teacher or Privatdozent shall supervise the student during the intern-ship. Academic staff may also be appointed as supervisors if they have long-standing successful teaching experience, and, upon recommendation of the Faculty Board, have been authorized to conduct examinations by the Rectorate as per § 52 para. 1 sentence 5 LHG.</p> |
| Forms of teaching/Amount of SWS | | | | Practical part + Lecture/15 SWS |
| Work load | | | | 400 h Attendance time 50 h Preparation and post-processing (report) |
| Credits for this unit | | | | 15 |
| Examination and unit completion | | | | Experience report: Students have complete their practical part by submitting a qualified final report to their supervisor. |
| Prerequisites | | | | All private or public institutions in Germany or abroad are suitable for the practical part if the student can experience practical work in the field of biological sciences there. Practical work experience (practical part) shall be at least two months in length. |
| Language | | | | depends on the respective research institution |
| Time slot and frequency of the course | | | | 1.-5. Semester (winter and summer semester) |

| | | | | |
|--|----|-----------------|---------|---|
| Study program/Usability Master Biological Sciences | | | | Master preparation course |
| Credits | 12 | Duration | 3 month | |
| Module grade | | | | The module is ungraded. |
| Module units | | | | The module consists of a practical part in the working group in which the master's thesis will be completed. |
| Educational objectives | | | | Specific preparation (in theory and practice) for the following work on the master's thesis. |
| Coordinator | | | | Supervisor of the following master's thesis |
| Teaching content | | | | Students become acquainted with the foundations of the intended topic area of their master's thesis. In particular, they will acquire special methodological knowledge and learn how to use the relevant expert literature. |
| Forms of teaching/Amount of SWS | | | | Practical part + Literature work/15 SWS |
| Work load | | | | 360 h |
| Credits for this unit | | | | 12 |
| Examination and unit completion | | | | Progress report (oral or written) |
| Prerequisites | | | | Students must have successfully completed all course-related performance assessments (according to the Study and Examination Regulations). |
| Language | | | | English |
| Time slot and frequency of the course | | | | 3. semester |

| | | | | | |
|---|--|-----------------|---------|---|------|
| Study program/Usability Master Biological Sciences Master Life Science | | | | Module TITLE Masters project | |
| Credits | 30 | Duration | 6 Month | Part of module of total rating | 33 % |
| Module grade | The grade of the Masters project is calculated as the average of the grades provided by the two referees. | | | | |
| Coordinator | Lecturers of the Department of Biology | | | | |
| Educational objectives | The students are expected to pursue a scientific project in the area of biology, within a given time frame, in an independent manner, and to document their achievements in form of a written thesis. | | | | |
| Teaching content | Aim is to impart the ability to independently establish a work-plan suited to complete the proposed masters-project within the prescribed time-frame, independently acquire knowledge corresponding to the current state of the scientific literature, gaining expertise in the methods and approaches required to perform the experimental work, independently examine, analyze, rate and discuss the achieved results, and collate all of the above in form of a written masters-thesis. | | | | |
| Forms of teaching/ Amount of SWS | full-day tutoring in how to work scientifically as part of a team | | | | |
| Work load | 900 hours | | | | |
| Examination and unit completion | Preparation of the written master's thesis | | | | |
| Prerequisites | Successful completion of all exams specified in the rules and regulations governing the "Masters Biological Sciences" or "Masters Life Science" course of studies Immatri-culation at the University of Konstanz | | | | |
| Language | German, English | | | | |
| Time slot and frequency of the course | Winter- and Summer-semester | | | | |
| Recommended Term | 4. Semester | | | | |
| Compulsory/ Optional course | Compulsory course | | | | |
